

Data-Driven Ddok-Bus Service-Area Expansion Analysis - Public Excerpt

Public-safe technical excerpt derived from the original project output.

Source: Ajou University Big Data Systems / Machine Learning course project outputs

Objective

Identify candidate 1 km x 1 km grids for DRT service-area expansion using public demographic, transit, medical/welfare, convenience-facility, and industrial variables.

Model results

Accuracy 0.7866; Precision 0.7518; Recall 0.1936; F1-score 0.3079; ROC-AUC 0.6531.

Decision framing

Because recall was low, predicted probabilities were used as a candidate-ranking signal rather than a definitive installed/not-installed classifier.

Spatial review

High-probability grids were reviewed with surrounding spatial clusters, distance from existing service areas, and real-world map context.

Public release scope

Student IDs and internal drafting comments present in the working document were removed from the public version.
